

K-9 BSD Training Containers

Passive Alert

An adapter plate is used to hold target odor in a concentrated and confined area at container entry hole. It also serves to position both device and PVC tubes in containers. **Note: The device container has 1/4" hole in base the rivet can be removed from device base and inserted thru container to secure in place.**

The PVC tubes have set ring to hold reward item in same position as device creating a visually consistent odor source.

This design creates a clear & concentrated odor source with very limited amount of non target odors. The reward and related plastic odors are extinction trained with use of the PVC tube and matching components. Testing has shown this is very efficient for the dog to learn multiple odors.

Cold weather climates: Container can easily crack or shatter during use or transporting in temps below 10 degrees.
