

K-9 BSD Training Containers

Plastic containers, components and stainless steel hardware are used. An adapter plate is used to hold target odor in a concentrated and confined area at container entry hole. It also serves to position both device and PVC tubes in containers.

The PVC tubes have set ring to hold reward item in same position as device creating a visually consistent odor source.

This design creates a clear & concentrated odor source with very limited amount of non target odors. The reward and related plastic odors are extinction trained with use of the PVC tube and matching components. Testing has shown this is very efficient for the dog to learn multiple odors.

The device (target odor) container, adapter, lid should be marked and always used together

Note: The device container has plastic cushion at base to absorb recoil
